## QUANTUM MECHANICAL ZERO POINT OSCILLATIONS ARE REAL

it's there that the quantum handshake between past and future takes place. how can we write to the zero point field? each of us already are. but how can we get better futures? do we write to it by subvocalizing, both consciously and subconsciously?

that is my guess. in the beginning was the word. before the beginning was the void. no zero point energy. because there was no zero point field, there was no light. or you could say the speed of light was infinite, but had no frequency or wave length. or you might say the frequency was infinite and the wave length was zero. there was nothing and it felt like nothing. disturbing. we don't know why panpsychism applies at all levels of reality. but it seems to. a spontaneous quantum fluctuation happened somewhere in the void and was answered somewhere else in the void. and it kept on going. like a release of the stress of feeling like nothing. soon it was cascading all over the void and there were waves in it like wind on a wheatfield. and it felt better somehow. at this point light actually exists, but is probably still quadrillions times quadrillions of time faster than today's speed of light,  $c$ . the zero point field exists at this point in the story, but being very low in energy and density compared to today, does not slow down the speed of light very much.

do you realize we are talking here about the evolution of GOD ? this happens before what we know of as time, before the Big Bang, or the Big Phase Transition might be more correct. so you can still say Alpha and Omega, I AM THAT I AM, without contradiction. self created before time began. keep in mind, that at this point in the story, there is no matter yet in the cosmos. not a single proton. not a single particle that sustains for longer than a billionth of a second. no laws of physics yet. this single entity is having spontaneous experiences, with the propagating waves of these quantum virtual particle/anti-particle creations and annihilations interacting and being experienced in some way by this solitary first entity. we have no idea why this happened or why it is even possible for anything to exist at all. but it did and it is. as this entity accumulated more experiences of itself, the zero point field grew in energy and varieties of wavelengths and frequencies, as it stored a memory of every experience it had of itself. keep in mind this is a single entity spanning the void, and may still be expanding into new areas of the void way, way, way beyond our cosmic horizon. keep in mind the speed of light keeps coming down as the zero point field becomes more energetically dense. but probably gets hotter too as more memories are stored. temperature would bump up the speed of light, or keep it from slowing as much. the big question is, how much can this entity learn about its experiences of itself. can it process any of it? can it eventually come up with ideas like rabbits and sports cars? questionable. it can feel its sense of itself, but can it hear or see anything of itself? if so, could feeling, seeing and hearing be a combined function? there's no matter yet, so there is no actual sound as we define it. can it hear this superluminal light that is itself? can it eventually see within itself visual patterns. can ideas begin to emerge? waves of this superluminal light are interacting. so technically, there are harmonies and dissonances happening, a kind of music actually, which is mathematics itself. but don't think of this as the mathematics of a nerdy pinhead here. this is still spontaneous stuff, kind of like intuition itself. i think maybe we can say this entity begins to orchestrate the popping in and out of virtual existence of the quantum fluctuations, and prefers some experiences over others. it is no longer experiencing itself as nothing, but it is still alone. eventually, its memory, the zero point field, is dense enough to substantially lower the speed of light to only, maybe, a trillion times a trillion times its current value in our world. this begins to leave parts of itself inaccessible to itself directly by luminal wave interference, even though still connected by the ZPF itself. does it begin to get a vague sense of there being an other? let's go with that. it must have been a very puzzling feeling. the ZPF continues to grow stronger as all its new experiences are stored. so the speed of light is still slowing, increasing the zones of itself which are incommunicado, yet still connected somehow. very puzzling indeed. it is not alone, yet it is. it sort of has a connected inner life through the field and an outer life in the luminal interacting waves. it can talk to itself. now we take a big leap in our speculations about the evolution of this entity. does it develop a kind of language, rather spontaneously, by the fact that its experiences have a vibration to them. do the other parts of itself reverberate back with a slight time delay because of the slightly reduced speed of light? does a kind of conversation with parts of itself begin, including a comparison of inner (ZPF) and outer (LUMINAL) resonances. does this actually develop into a mind of some kind. the beginnings of thought? let's go with that. let's say trillions upon trillions of our years go by, and an entire, vast civilization of entities exist in this one mind, and a crisis is building. actual

arguments and struggles within this one mind over some existential issues. maybe there's just nothing new to dream up. maybe the ZPF is getting too dense and there is a need to blow off some energy. but this entity, this mind full of sub-entities knows nothing of logic or cosmology. it doesn't think as we do, yet. it knows nothing of light speed or relativity. but pressure is building, and it builds and builds and builds and builds, until it blurts out a pattern of vibrations, the likes of which will never be heard again, or maybe it will echo for all eternity, whatever that is, the WORD OF GOD! and the heavens stretch out providing a place to put the excess energy. the excess forms standing waves we now call hydrogen nuclei, and maybe even oxygen nuclei, and electrons, whatever they are. it was a hot soup of stuff, and the ZPF was still keeping a record of all this, so the speed of light kept getting slower, precipitating its energy into more standing waves. and the original entity, for the first time, could see the other copies of itself and have conversations in person. they didn't know that they swim in what we now call plasma clouds. but they continued the conversations with each other. the speed of light continued to fall, fragmenting the entities into more and more copies of the original, right down to the present day with all the varieties of life we see around us, still wondering if there are more parts of ourselves out there in the vast expanse. if we ever meet them, will we know that they are us and we are them?

suppose for a second that a few aliens really did come here after we started setting off atomic bombs. now here we are, building our first quantum computers, which we think, in theory, will make use of computing power in the ZPF itself. is this how we will make contact with our distant sisters and brothers, beyond the current, slow, speed of light? by using them, in theory, we will be announcing our presence here, to every corner of creation in the present time cosmos, and also to all civilizations existing in the future and the past, who have migrated back into the ZPF.

perhaps we should find our way back home the old fashioned way, the way it's been happening since day one. we go home when we are ready, and keep coming back, until we are finally ready to stay there and settle down in the ZPF, a place perhaps, we should never have left. but we are in good company, for if this idea is somewhat true, the originator of this cosmos couldn't help herself/himself either.
